Veneers

What are Veneers?

Veneers are thin, custom-made facings that cover the fronts of unsightly teeth. Veneers are made from tooth-colored, high-tech materials to give you a natural, bright smile.

Should You Consider Veneers?

Veneers are an alternative to full crowns. They can fill unattractive gaps. They can help stained, misshaped, or crooked teeth. If your teeth have gaps, stains, or cracked parts, veneers may be your best option.

How Long will Veneers Last?

Veneers can last for many years. Unlike most bonded materials, veneers will not change color over time. You should consult with Dr Cajee to find out how long veneers may last in your mouth.

How are Veneers Made?

Your tooth is reshaped to allow for the added thickness of the veneer. A molded image is taken of the reshaped tooth and sent to a dental lab. The veneer is custom-made to fit you. The veneer is applied with adhesive which bonds it to the original tooth structure.
